

WHAT YOU SHOULD KNOW ABOUT YOUR NEW ENERGY TIMER

Congratulations! As part of UI's continuing effort to provide you with the latest tools in energy management, we have installed an Energy Timer on your water heater. UI is pleased to bring this technology to your home at no incremental cost to you. The high efficiency Hubbell brand water heaters are designed to heat your water during off peak hours (typically at night) when lower electric rates occur, and then store the heated water for your use during peak hours (typically during the day). The Energy Timer has been pre-programmed to ensure that your water heater operates during off-peak hours. You don't need to do a thing!

However, there may be times when you want to override the Energy Timer. To provide you with that flexibility, if you choose to, you can temporarily override the settings we have programmed for the Energy Timer. There are two features we want to tell you about.

VACATION - Use this function if you are going on vacation or have no need for hot water for an extended period of time (typically 3 days or more). You save money and energy by preventing the lower heating element from turning on and thus heating up the entire tank. To enter VACATION mode, simply PRESS the OFF button and a red "Ø" symbol and "X" will appear on the display screen. Once you return from your time away, PRESS the ON button once and the red "X" will no longer be visible. Your water heater will now operate as normal, but may not be fully hot as it has been in vacation mode for some period of time. After exiting from vacation mode you may decide to start heating your water immediately by putting the heater in an "override" mode, which simply means it will allow the lower heating element to begin heating, regardless of the time of day. To put the heater in this temporary mode, press the ON button again and a "√" will appear on the display.

OVERRIDE - Use this function if you experience an event that requires more hot water than usual. For example, relatives visiting or holidays. With the override feature you have the capability to temporarily override the off-peak programming hours and allow the lower heating element to heat water during on-peak hours. You can only use the override feature one time per day. Simply PRESS the ON button and a "√" appears on the display screen. The heater will automatically come out of override and resume its normal mode of operation the next day, so there is no need to remember to take it out of override mode. However, please remember that in override mode you will be using energy during peak hours, which costs more than operating your heater during off-peak hours.

Or simply do nothing and enjoy your carefree water heater! Leave everything to us! If you need any assistance with your new Energy Timer or have any questions about your lease, please don't hesitate to call us...anytime!
